### Abstract

*With the dominance of top-down development, the aspirations of the community's ideas in every stage of construction development are not perfectly absorbed, resulting in community antipathy towards every government policy. Therefore, to recreate public sympathy, the government released a program to strengthen village governance and development (P3PD) or better known as the village fund program. The AHP (Analytical Hierarchy Process) method is used to analyze the results of the questionnaire so that the weight value of the criteria and sub criteria can be known as the basis for selecting the implementation of construction activities. Based on the results of the analysis, the weight value of the criteria can be found as follows: quality criteria are the main criteria in the selection of construction projects with a weight of 0.235, cost with a weight of 0.203, time with a weight of 0.192, community participation with a weight of 0.144, labor with a weight of 0.117 and administration with a weight of 0.110.*

**Keywords:** Analytical Hierarchy Process Method, Self-management of Community Empowerment, Contractual

## 1. INTRODUCTION

One of the government's efforts in implementing bottom-up activities is the enactment of Law No. 6/2014 on villages, the implementation of which is the program to strengthen village governance and development (P3PD) or better known as the village fund program under the auspices of the Ministry of Villages, Development of Disadvantaged Regions and Transmigration. This program has been running since the year it was established, and all activities are purely sourced from the aspirations and creative ideas of the community, starting from the proposal stage, implementation, utilization to maintenance, all of which are based on village deliberations. The village fund program has objectives including improving the welfare of village communities, accelerating rural development and equitable development in Indonesia.

Self-management activities based on community empowerment in the village fund program prioritize the active participation of village communities to reduce unemployment and poverty, as stated in the provisions of the village fund program which requires allocating a minimum of 30% of the workforce in one of its infrastructure activities called village cash-intensive activities (PKTD). In addition to prioritizing local human resources, community empowerment-based self-management activities in the village fund program prioritize using local products or materials to raise the selling value of natural resources in the village.

The village fund program focuses on developing infrastructure, natural and human resources, and various programs such as education, food security, waste management, peace and public order, prevention, child and women protection, public health, clean water, disaster response, and inflation mitigation. Approaches include decentralization, community self-help, empowerment, participation, institutional capacity building, development program integration, alignment with the poor, gender equality, justice, and inclusion of minorities, women, and the elderly.

Good quality construction project management is a desirable goal. It can bring many benefits if executed well. However, there are obstacles like project delays, inadequate resources, subpar materials, and improper administrative procedures that can lead to serious problems such as cost overruns, complaints, loss of trust, and project failure.

This will certainly make a huge loss for all parties. However, this can be predicted early by considering important criteria that affect the success and smooth implementation of construction projects. In order for the implementation of a project to run smoothly and in accordance with the agreed specifications, it is necessary to take a good construction approach that is appropriate and can meet the requirements for achieving successful development, besides that it is also necessary to maintain communication and relationships with each stakeholder. In the implementation of construction projects, the balance between scope, schedule, cost, quality, resources and risk is needed to produce an activity that is as expected.

To analyze and evaluate performance in an activity implementation to achieve strategic goals, an indicator is needed, one of which is project management KPI (Key Performance Indicator) as a measuring tool in describing the criteria that determine the success of an organization's goals. KPI is also one way to find out about the validity of an alternative so that it really reaches the goal or purpose of a process. A good KPI must have several criteria as a measuring tool for an alternative analysis. KPIs are also used as navigation in making the direction of a goal that can be used as a target in the discussion.

In order to make decisions to analyze and evaluate an activity implementation, a method is needed. One method that is often used is the analytical hierarchy process (AHP) method. This method has the ability to prioritize and also decompose complex multi-criteria and variable problems into a hierarchical structure. The basic principles of AHP are compiling a hierarchical structure, assessing criteria with pairwise comparisons, determining priorities and consistency of methods. The advantage of the analytical hierarchy process (AHP) method is that it makes extensive irregular and unstructured problems into a model that is easy to understand. From the background above, it shows that there are important criteria that greatly affect the effectiveness of a construction project implementation.

Another method that is commonly used and is a continuation of the analytical hierarchy process (AHP) method is the analytic network process (ANP) method. Analytic Network Process (ANP) is a technique that helps solve a problem. ANP does not focus only on being used as a priority determinant of choices with many criteria, but also its use has developed as an alternative model for solving various problems. ANP is basically a general method of measuring tools. This method is more difficult than the AHP method because the ANP method requires relationships and dependence on networks. The ANP

method is able to improve the shortcomings that exist in the AHP method such as the ability to develop linkages between alternatives or criteria (Muhendra et al., n.d.).

The objectives to be achieved in this study are to analyze the criteria and sub-criteria that affect the effectiveness of the implementation of community empowerment-based self-management construction projects and contractual-based construction projects in Sumenep District.

## 2. RESEARCH METHODS

### 2.1. Research Flow

The research flow is a method used to determine the steps of research in order to produce a flow that is in accordance with the objectives and characteristics of the research.

Source: Processed by Researcher, 2024

**Figure 1. Research Flow**

The flowchart outlines the key steps in the research process, starting with identifying the research problem or question, followed by gathering and processing data through methods such as data collection, observation, interviews, and document review. It continues with developing a hypothesis, selecting appropriate research instruments based on theoretical frameworks and previous studies, and analyzing the data using a specific method or model, such as AHP. The process concludes with drawing conclusions and making recommendations, and final selection or decision.

### 2.2. Research Object

The object of this research is to focus on analyzing the implementation of community empowerment-based self-managed construction and contractual work in the village fund program in Sumenep District, East Java Province (Cahyono et al., 2022; Muhendra & Hasibuan, 2018; Nugroho et al., 2019).

### 2.3. Research Location

The research location analyzes the implementation of community empowerment-based self-managed construction and contractual work in Juruan Daya Village, Batuputih District, Sumenep Regency, East Java Province (Setiawan, 2017).

### 2.4. Research Instruments

The Research Instruments are as follows:

- a. The documents refer to the existing documents in Juruan Daya Village, Batuputih Sub-district, Sumenep District, East Java Province and in the relevant OPD.
- b. Stationery to record the results of interviews and observations.
- c. Mobile phone camera to document every activity and observation result.

### 2.5. Data Collection Procedure

- a. Primary data

Primary data is obtained directly either from the results of observations or direct observations in the field, questionnaires and interviews with respondents who are parties involved in the project or construction implementation program, namely service providers, commitment-making officials, community empowerment experts, academics, sub-district heads, relevant section heads, village facilitators / assistants, activity implementation teams, village councils, community leaders, workers and also village governments (Soetjipto et al., 2021).

- b. Secondary Data

Secondary data is data obtained from planning documents, implementation and accountability of the Juruan Daya Village government, Batuputih District, Sumenep Regency, East Java Province (Aziiz & Prastiti, 2019; Nahrudin, 2014). As for the sampling carried out is by judgment sampling method, meaning that the sample is selected based on the judgment of the researcher that the person concerned is the best party to be sampled and also uses random sampling, meaning that the sample is taken randomly. In this study the respondents were taken as many as 40 (forty) people with different levels of education and work experience.

### 2.6. Data Analysis Technique

Data analysis will be conducted after all necessary data is collected. The goal is to identify the most important success factor using the AHP method, project guidelines, and field data. The AHP method helps determine the priority of success criteria for the self-management project. This will ensure better control and improved results for the building construction project. (Zulkarnain, 2019).

The criteria that affect the implementation of construction are organized as a criterion, the criteria are further divided into several sub-criteria (Yulianto et al., 2022). Next is the preparation of a questionnaire to find out the opinions of respondents. Before the questionnaire was distributed to respondents, the validity and reliability of each question item was tested first on 29 (twenty-nine) respondents. If the questionnaire items are declared reliable and valid, then the questionnaire is distributed to 40 (forty) respondents.

### 3. RESULTS AND DISCUSSION

#### 3.1. Validity and Reliability Test of Questionnaire Items

Analyzing data using SPSS will help create reliable question items for research. Validity of questionnaire items is determined by  $r$  statistic and must be  $<0.05$ . With  $N=29$  and  $r_{table}=0.367$ , all items are valid. Reliability of question items is confirmed with Cronbach's Alpha  $>0.6$ , which was 0.902 in this case.

##### 3.1.1. Pairwise Comparison

One of the decision-making methods by comparing two or more alternatives using a varied scale used in this research is pairwise comparison. The assessment is carried out by giving weight to the criteria and sub criteria on a scale of 1 to 9.

#### a. Construction Project Implementation Criteria

**Table 1. Geomean Value**

| Criteria     | W            | B            | M            | P            | T            | A            |
|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| W            | 1,000        | 1,264        | 0,862        | 1,041        | 1,393        | 1,809        |
| B            | 0,791        | 1,000        | 0,871        | 1,611        | 1,827        | 2,068        |
| M            | 1,091        | 1,149        | 1,000        | 1,907        | 1,884        | 2,288        |
| P            | 0,961        | 0,621        | 0,524        | 1,000        | 1,441        | 1,114        |

**Table 3. Consistency Test**

| Criteria | W     | B     | M     | P     | T     | A     | Total |
|----------|-------|-------|-------|-------|-------|-------|-------|
| W        | 0,192 | 0,242 | 0,165 | 0,200 | 0,267 | 0,347 | 1,413 |
| B        | 0,161 | 0,203 | 0,177 | 0,327 | 0,371 | 0,420 | 1,660 |
| M        | 0,256 | 0,270 | 0,235 | 0,448 | 0,442 | 0,537 | 2,188 |
| P        | 0,138 | 0,089 | 0,075 | 0,144 | 0,207 | 0,160 | 0,813 |
| T        | 0,084 | 0,064 | 0,062 | 0,081 | 0,117 | 0,123 | 0,530 |
| A        | 0,067 | 0,053 | 0,047 | 0,099 | 0,105 | 0,110 | 0,480 |

**Table 4. Finding Vector [A]**

|   |       |   |       |   |               |
|---|-------|---|-------|---|---------------|
| W | 1,413 | / | 0,192 | = | <b>7,368</b>  |
| B | 1,660 | / | 0,203 | = | <b>8,168</b>  |
| M | 2,188 | / | 0,235 | = | <b>9,318</b>  |
| P | 0,813 | / | 0,144 | = | <b>5,661</b>  |
| T | 0,530 | / | 0,117 | = | <b>4,540</b>  |
| A | 0,480 | / | 0,110 | = | <b>4,367</b>  |
|   |       |   | Total | = | <b>39,442</b> |

Amount of data (n) = 6

Find the maximum eigenvector value ( $\lambda_{\max}$ ):

$$\lambda_{\max} = \frac{\text{vektor [A]}}{n} = \frac{39,442}{6} = 6,570$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{6,570 - 6}{6 - 1} = 0,114$$

Finding the Random Index (RI):

the value of n = 6 then the value RI = 1,24

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,114}{1,24} = 0,092 = 9,20 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

## b. Time Criteria in Construction Project Implementation

**Table 5. Geomean Value**

| Criteria     | W1           | W2           | W3           |
|--------------|--------------|--------------|--------------|
| W1           | 1,000        | 0,775        | 1,409        |
| W2           | 1,290        | 1,000        | 1,347        |
| W3           | 0,710        | 0,742        | 1,000        |
| <b>Total</b> | <b>2,999</b> | <b>2,518</b> | <b>3,756</b> |

**Table 6. Normalization of Pairwise Matrix**

| Criteria     | W1           | W2           | W3           | Average      |
|--------------|--------------|--------------|--------------|--------------|
| W1           | 0,333        | 0,308        | 0,375        | 0,339        |
| W2           | 0,430        | 0,397        | 0,359        | 0,395        |
| W3           | 0,237        | 0,295        | 0,266        | 0,266        |
| <b>Total</b> | <b>1,000</b> | <b>1,000</b> | <b>1,000</b> | <b>1,000</b> |

**Table 7. Consistency test**

| Criteria | W1    | W2    | W3    | Total |
|----------|-------|-------|-------|-------|
| W1       | 0,339 | 0,263 | 0,478 | 1,079 |
| W2       | 0,510 | 0,395 | 0,532 | 1,437 |
| W3       | 0,189 | 0,197 | 0,266 | 0,652 |

**Table 8. Finding Vector [A]**

|    |       |   |       |   |       |
|----|-------|---|-------|---|-------|
| W1 | 1,079 | / | 0,339 | = | 3,185 |
| W2 | 1,437 | / | 0,395 | = | 3,637 |
| W3 | 0,652 | / | 0,266 | = | 2,452 |
|    |       |   | Total | = | 9,273 |

Amount of data (n) = 3

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vektor [A]}}{n} = \frac{9,273}{3} = 3,091$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{3,091 - 3}{3 - 1} = 0,046$$

Finding the Random Index (RI):

the value of n = 3 then the value RI = 0,58

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,046}{0,58} = 0,079 = 7,85 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

### c. Cost Criteria in the Implementation of Construction Projects

**Table 9. Geomean Value**

| Criteria | B1    | B2    | B3    | B4    | B5    | B6     |

| <b>B6</b> | 0,039 | 0,037 | 0,049 | 0,051 | 0,057 | 0,091 | <b>0,325</b> |

**Table 12. Finding Vector [A]**

|           |       |   |       |   |               |
|-----------|-------|---|-------|---|---------------|
| <b>B1</b> | 2,106 | / | 0,234 | = | 8,999         |
| <b>B2</b> | 1,296 | / | 0,180 | = | 7,189         |
| <b>B3</b> | 1,305 | / | 0,183 | = | 7,127         |
| <b>B4</b> | 0,962 | / | 0,156 | = | 6,173         |
| <b>B5</b> | 0,950 | / | 0,155 | = | 6,119         |
| <b>B6</b> | 0,325 | / | 0,091 | = | 3,559         |
| Total     |       |   |       | = | <b>39,166</b> |

Amount of data (n) = 6

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \max = \frac{\text{vektor [A]}}{n} = \frac{39,166}{6} = 6,528$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maksimum}} - n}{n - 1} = \frac{6,528 - 6}{6 - 1} = 0,106$$

Finding the Random Index (RI):

n = 6 then the value of RI = 1,24

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,106}{1,24} = 0,085 = 8,51 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

**d. Quality Criteria in Construction Project Implementation**

**Table 13. Geomean Value**

| Criteria     | M1           | M2           | M3           |
|--------------|--------------|--------------|--------------|
| M1           | 1,000        | 1,234        | 0,641        |

| M3       | 0,641 | 0,579 | 0,420 | <b>1,640</b> |

**Table 16. Finding Vector [A]**

|    |       |   |       |   |              |
|----|-------|---|-------|---|--------------|
| M1 | 0,874 | / | 0,304 | = | <b>2,875</b> |
| M2 | 0,699 | / | 0,276 | = | <b>2,536</b> |
| M3 | 1,640 | / | 0,420 | = | <b>3,902</b> |

Amount of data (n) = 3

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vector [A]}}{n} = \frac{9,313}{3} = 3,104$$

Finding the Consistency Index (CI):

$$CI = (\lambda \text{ (Maximum) } - n) / (n - 1) = (3,104 - 3) / (3 - 1) = 0,052$$

Finding the Random Index (RI):

N value = 3 then the value of RI = 0,58

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,052}{0,58} = 0,090 = 9,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

| P4       | 0,480 | 0,011 | 0,000 | 0,180 | 0,670 |

Table 19. Finding Vector [A]

|       |       |   |       |   |        |
|-------|-------|---|-------|---|--------|
| P1    | 1,024 | / | 0,262 | = | 3,912  |
| P2    | 0,939 | / | 0,248 | = | 3,790  |
| P3    | 1,441 | / | 0,311 | = | 4,640  |
| P4    | 0,670 | / | 0,180 | = | 3,726  |
| Total |       |   |       | = | 16,068 |

Amount of data (n) = 4

Find the maximum eigenvector value ( $\lambda_{\max}$ ):

$$\lambda_{\max} = \frac{\text{vector [A]}}{n} = \frac{16,068}{4} = 4,017$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{4,017 - 4}{4 - 1} = 0,006$$

Finding the Random Index (RI):

the value of n = 4 then the value of RI = 0,90

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,006}{0,90} = 0,006 = 0,63 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

**f. Labor Criteria in the Implementation of Construction Projects**

**Table 20. Geomean Value**

| Criteria     | T1           | T2           | T3           | T4           | T5           |

| T5       | 0,288 | 0,198 | 0,336 | 0,460 | 0,239 | 1,520 |

**Table 23. Finding Vector [A]**

|    |       |   |       |   |               |
|----|-------|---|-------|---|---------------|
| T1 | 1,472 | / | 0,231 | = | 6,367         |
| T2 | 1,660 | / | 0,249 | = | 6,655         |
| T3 | 0,440 | / | 0,128 | = | 3,429         |
| T4 | 0,635 | / | 0,153 | = | 4,162         |
| T5 | 1,520 | / | 0,239 | = | 6,372         |
|    |       |   | Total | = | <b>26,985</b> |

Amount of data (n) = 5

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vector [A]}}{n} = \frac{26,985}{5} = 5,397$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{Maximum} - n}{n - 1} = \frac{5,397 - 5}{5 - 1} = 0,099$$

Finding the Random Index (RI):

the value of n = 5 then the value RI = 1,12

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,099}{1,12} = 0,089 = 8,86 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

#### g. Administrative Criteria in Construction Project Implementation

**Table 24. Geomean Value**

| Criteria     | A1           | A2           | A3           |
|--------------|--------------|--------------|--------------|
| A1           | 1,000        | 0,724        | 1,137        |
| A2           | 1,351        | 1,000        | 1,470        |
| A3           | 0,879        | 0,719        | 1,000        |
| <b>Total</b> | <b>3,230</b> | <b>2,442</b> | <b>3,607</b> |

**Table 25. Normalization of Pairwise Matrix**

| Criteria     | A1           | A2           | A3           | Average      |
|--------------|--------------|--------------|--------------|--------------|
| A1           | 0,310        | 0,296        | 0,315        | <b>0,307</b> |
| A2           | 0,418        | 0,409        | 0,407        | <b>0,412</b> |
| A3           | 0,272        | 0,294        | 0,277        | <b>0,281</b> |
| <b>Total</b> | <b>1,000</b> | <b>1,000</b> | <b>1,000</b> | <b>1,000</b> |

**Table 25. Consistency test**

| Criteria | A1    | A2    | A3    | Total        |
|----------|-------|-------|-------|--------------|
| A1       | 0,307 | 0,222 | 0,349 | <b>0,878</b> |
| A2       | 0,556 | 0,412 | 0,605 | <b>1,573</b> |
| A3       | 0,247 | 0,202 | 0,281 | <b>0,731</b> |

**Table 25. Consistency test**

|              |       |   |       |   |              |
|--------------|-------|---|-------|---|--------------|
| A1           | 0,878 | / | 0,307 | = | <b>2,861</b> |
| A2           | 1,573 | / | 0,412 | = | <b>3,821</b> |
| A3           | 0,731 | / | 0,281 | = | <b>2,598</b> |
| <b>Total</b> |       |   |       | = | <b>9,279</b> |

Amount of data (n) = 3

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vektor [A]}}{n} = \frac{9,279}{3} = 3,093$$

Finding the Consistency Index (CI):

$$CI = (\lambda (\text{Maximum}) - n) / (n - 1) = (3,093 - 3) / (3 - 1) = 0,047$$

Finding the Random Index (RI):  
the value of  $n = 3$  then the value  $RI = 0,58$

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,047}{0,58} = 0,080 = 8,03 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

#### h. Alternative Construction Project Implementation

**Table 26. Geomean Value**

| Criteria        | Contractual  | Self-management |
|-----------------|--------------|-----------------|
| Contractual     | 1,000        | 1,002           |
| Self-management | 0,998        | 1,000           |
| <b>Total</b>    | <b>1,998</b> | <b>2,002</b>    |

**Table 27. Normalization of Pairwise Matrix**

| Criteria        | Contractual  | Self-management | Average      |
|-----------------|--------------|-----------------|--------------|
| Contractual     | 0,501        | 0,501           | 0,501        |
| Self-management | 0,499        | 0,499           | 0,499        |
| <b>Total</b>    | <b>1,000</b> | <b>1,000</b>    | <b>1,000</b> |

**Table 28. Consistency test**

| Criteria        | Contractual | Self-management | Total |
|-----------------|-------------|-----------------|-------|
| Contractual     | 0,501       | 0,502           | 1,002 |
| Self-management | 0,498       | 0,499           | 0,998 |

**Table 29. Finding Vector [A]**

|                 |       |   |              |   |              |
|-----------------|-------|---|--------------|---|--------------|
| Contractual     | 1,002 | / | 0,501        | = | <b>2,002</b> |
| Self-management | 0,998 | / | 0,499        | = | <b>1,998</b> |
|                 |       |   | <b>Total</b> | = | <b>4,000</b> |

Amount of data ( $n$ ) = 2

Find the maximum eigenvector value ( $\lambda \max$ ):

$$\lambda \max = \frac{\text{vector [A]}}{n} = \frac{4,000}{2} = 2,000$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{2,000 - 2}{2 - 1} = 0,00000277$$

Finding the Random Index (RI):

the value of  $n = 2$  then the value of  $RI = 0,00$

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,00000277}{0,00} = 0,000 = 0,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

#### i. Alternative Construction Project Implementation Criteria Against Time

**Table 30. Geomean Value**

| Criteria        | Contractual  | Self-management |
|-----------------|--------------|-----------------|
| Contractual     | 1,000        | 1,416           |
| Self-management | 0,719        | 1,000           |
| <b>Total</b>    | <b>1,719</b> | <b>2,416</b>    |

**Table 31. Normalization of Pairwise Matrix**

| Criteria        | Contractual  | Self-management | Average      |
|-----------------|--------------|-----------------|--------------|
| Contractual     | 0,582        | 0,586           | 0,584        |
| Self-management | 0,418        | 0,414           | 0,416        |
| <b>Total</b>    | <b>1,000</b> | <b>1,000</b>    | <b>1,000</b> |

**Table 32. Consistency test**

| Criteria        | Contractual | Self-management | Total |
|-----------------|-------------|-----------------|-------|
| Contractual     | 0,584       | 0,827           | 1,411 |
| Self-management | 0,299       | 0,416           | 0,715 |

**Table 33. Finding Vector [A]**

|                 |       |   |       |   |              |
|-----------------|-------|---|-------|---|--------------|
| Contractual     | 1,411 | / | 0,584 | = | <b>2,416</b> |
| Self-management | 0,715 | / | 0,416 | = | <b>1,719</b> |
| <b>Total</b>    |       |   |       | = | <b>4,134</b> |

Amount of data (n) = 2

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \max = \frac{\text{vektor [A]}}{n} = \frac{4,134}{2} = 2,067$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{2,067 - 2}{2 - 1} = 0,067$$

Finding the Random Index (RI):

the value of n = 2 then the value of RI = 0,00

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,067}{0,00} = 0,000 = 0,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

**j. Alternative Construction Project Implementation Criteria against Cost Criteria**

**Table 34. Geomean Value n**

| Criteria        | Contractual  | Self-management |
|-----------------|--------------|-----------------|
| Contractual     | 1,000        | 0,966           |
| Self-management | 1,036        | 1,000           |
| <b>Total</b>    | <b>2,036</b> | <b>1,966</b>    |

**Table 35. Normalization of Pairwise Matrix**

| Criteria        | Contractual  | Self-management | Average      |
|-----------------|--------------|-----------------|--------------|
| Contractual     | 0,491        | 0,491           | 0,491        |
| Self-management | 0,509        | 0,509           | 0,509        |
| <b>Total</b>    | <b>1,000</b> | <b>1,000</b>    | <b>1,000</b> |

**Table 36. Consistency test**

| Criteria        | Contractual | Self-management | Total |
|-----------------|-------------|-----------------|-------|
| Contractual     | 0,491       | 0,474           | 0,966 |
| Self-management | 0,527       | 0,509           | 1,036 |

**Table 37. Finding Vector [A]**

|                 |       |   |              |   |              |
|-----------------|-------|---|--------------|---|--------------|
| Contractual     | 0,966 | / | 0,491        | = | <b>1,966</b> |
| Self-management | 1,036 | / | 0,509        | = | <b>2,036</b> |
|                 |       |   | <b>Total</b> | = | <b>4,001</b> |

Amount of data (n) = 2

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vektor [A]}}{n} = \frac{4,001}{2} = 2,001$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{2,001 - 2}{2 - 1} = 0,001$$

Finding the Random Index (RI):

the value of n = 2 then the value of RI = 0,00

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,001}{0,00} = 0,000 = 0,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

k. **Alternative Construction Project Implementation Criteria Against Quality Criteria**

**Table 38. Geomean Value**

| Criteria        | Contractual  | Self-management |
|-----------------|--------------|-----------------|
| Contractual     | 1,000        | 1,009           |
| Self-management | 1,002        | 1,000           |
| <b>Total</b>    | <b>2,002</b> | <b>2,009</b>    |

**Table 39. Normalization of Pairwise Matrix**

| Criteria        | Contractual  | Self-management | Average      |
|-----------------|--------------|-----------------|--------------|
| Contractual     | 0,500        | 0,502           | 0,501        |
| Self-management | 0,500        | 0,498           | 0,499        |
| <b>Total</b>    | <b>1,000</b> | <b>1,000</b>    | <b>1,000</b> |

**Table 40. Consistency test**

| Criteria        | Contractual | Self-management | Total |
|-----------------|-------------|-----------------|-------|
| Contractual     | 0,501       | 0,505           | 1,006 |
| Self-management | 0,500       | 0,499           | 0,999 |

**Table 41. Finding Vector [A]**

|                 |       |   |       |   |              |
|-----------------|-------|---|-------|---|--------------|
| Contractual     | 1,006 | / | 0,501 | = | <b>2,009</b> |
| Self-management | 0,999 | / | 0,499 | = | <b>2,002</b> |
| <b>Total</b>    |       |   |       | = | <b>4,010</b> |

Amount of data (n) = 2

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vector [A]}}{n} = \frac{4,010}{2} = 2,005$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{2,005 - 2}{2 - 1} = 0,005$$

Finding the Random Index (RI):

the value of n = 2 then the value of RI = 0,00

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,005}{0,00} = 0,000 = 0,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

l. **Alternative Construction Project Implementation Criteria against Community Participation Criteria**

**Table 42. Geomean Value**

| Criteria        | Contractual  | Self-management |
|-----------------|--------------|-----------------|
| Contractual     | 1,000        | 0,359           |
| Self-management | 2,789        | 1,000           |
| <b>Total</b>    | <b>3,789</b> | <b>1,359</b>    |

**Table 43. Normalization of Pairwise Matrix**

| Criteria        | Contractual  | Self-management | Average      |
|-----------------|--------------|-----------------|--------------|
| Contractual     | 0,264        | 0,264           | 0,264        |
| Self-management | 0,736        | 0,736           | 0,736        |
| <b>Total</b>    | <b>1,000</b> | <b>1,000</b>    | <b>1,000</b> |

**Table 44. Consistency test**

| Criteria        | Contractual | Self-management | Total |
|-----------------|-------------|-----------------|-------|
| Contractual     | 0,264       | 0,095           | 0,359 |
| Self-management | 2,052       | 0,736           | 2,789 |

**Table 45. Finding Vector [A]**

|                 |       |   |       |          |              |
|-----------------|-------|---|-------|----------|--------------|
| Contractual     | 0,359 | / | 0,264 | =        | 1,359        |
| Self-management | 2,789 | / | 0,736 | =        | 3,789        |
| <b>Total</b>    |       |   |       | <b>=</b> | <b>5,147</b> |

Amount of data (n) = 2

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vector [A]}}{n} = \frac{5,147}{2} = 2,574$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{2,574 - 2}{2 - 1} = 0,574$$

Finding the Random Index (RI):

the value of n = 2 then the value of RI = 0,00

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,574}{0,00} = 0,000 = 0,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

#### **m. Alternative Construction Project Implementation Criteria against Labor Criteria**

**Table 46. Geomean Value**

| Criteria    | Contractual | Self-management |
|-------------|-------------|-----------------|
| Contractual | 1,000       | 1,316           |

|                 |              |              |
|-----------------|--------------|--------------|
| Self-management | 0,760        | 1,000        |
| <b>Total</b>    | <b>1,760</b> | <b>2,316</b> |

**Table 47. Normalization of Pairwise Matrix**

| Criteria        | Contractual  | Self-management | Average      |
|-----------------|--------------|-----------------|--------------|
| Contractual     | 0,568        | 0,568           | 0,568        |
| Self-management | 0,432        | 0,432           | 0,432        |
| <b>Total</b>    | <b>1,000</b> | <b>1,000</b>    | <b>1,000</b> |

**Table 48. Consistency test**

| Criteria        | Contractual | Self-management | Total |
|-----------------|-------------|-----------------|-------|
| Contractual     | 0,568       | 0,748           | 1,316 |
| Self-management | 0,328       | 0,432           | 0,760 |

**Table 49. Finding Vector [A]**

|                 |       |   |              |   |              |
|-----------------|-------|---|--------------|---|--------------|
| Contractual     | 1,316 | / | 0,568        | = | <b>2,316</b> |
| Self-management | 0,760 | / | 0,432        | = | <b>1,760</b> |
|                 |       |   | <b>Total</b> | = | <b>4,076</b> |

Amount of data (n) = 2

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \max = \frac{\text{vektor [A]}}{n} = \frac{4,076}{2} = 2,038$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{2,038 - 2}{2 - 1} = 0,038$$

Finding the Random Index (RI):

the value of n = 2 then the value of RI = 0,00

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,038}{0,00} = 0,000 = 0,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

#### n. Alternative Construction Project Implementation Criteria Against Administration Criteria

**Table 50. Geomean Value**

| Criteria        | Contractual  | Self-management |
|-----------------|--------------|-----------------|
| Contractual     | 1,000        | 1,254           |
| Self-management | 0,797        | 1,000           |
| <b>Total</b>    | <b>1,797</b> | <b>2,254</b>    |

**Table 51. Normalization of Pairwise Matrix**

| Criteria        | Contractual  | Self-management | Average      |
|-----------------|--------------|-----------------|--------------|
| Contractual     | 0,556        | 0,556           | 0,556        |
| Self-management | 0,444        | 0,444           | 0,444        |
| <b>Total</b>    | <b>1,000</b> | <b>1,000</b>    | <b>1,000</b> |

**Table 51. Consistency test**

| Criteria        | Contractual | Self-management | Total |
|-----------------|-------------|-----------------|-------|
| Contractual     | 0,556       | 0,698           | 1,254 |
| Self-management | 0,354       | 0,444           | 0,797 |

**Table 52. Finding Vector [A]**

|                 |       |   |       |   |              |
|-----------------|-------|---|-------|---|--------------|
| Contractual     | 1,254 | / | 0,556 | = | <b>2,254</b> |
| Self-management | 0,797 | / | 0,444 | = | <b>1,797</b> |
| <b>Total</b>    |       |   |       | = | <b>4,052</b> |

Amount of data (n) = 2

Find the maximum eigenvector value ( $\lambda$  max):

$$\lambda \text{ max} = \frac{\text{vector [A]}}{n} = \frac{4,052}{2} = 2,026$$

Finding the Consistency Index (CI):

$$CI = \frac{\lambda_{\text{Maximum}} - n}{n - 1} = \frac{2,026 - 2}{2 - 1} = 0,026$$

Finding the Random Index (RI):

the value of n = 2 then the value of RI = 0,00

Finding Consistency Ratio (CR):

$$CR = \frac{CI}{RI} = \frac{0,026}{0,00} = 0,000 = 0,00 \%$$

With a CR value smaller than 0.1 or 10%, the conclusion is that the data used is consistent and can be accounted for.

#### 4. CONCLUSION

Based on the results of the research analysis that has been carried out, comparing alternative contractual-based construction implementation and community empowerment-based self-management construction implementation, the following conclusions can be drawn: The important criteria that influence the selection between contractual-based construction project implementation and community empowerment-based self-management construction implementation were identified through surveys, interviews, and in conjunction with Project Management KPIs. These criteria include time, cost, quality, community participation, labor, and administration. The analysis results show that the quality criteria are the most important, with a weight of 0.235.

Within the quality criteria, the sub-criteria of quality suitability has the highest weight, at 0.420.
